

PATENT APPLICATION

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicants : James W. Baumgartner et al.

Serial No. : 09/090,867

Filed : June 4, 1998

For : TESTIS-SPECIFIC RECEPTOR

Examiner : Lazar-Wesley, E.

Art Unit : 1646

Docket No.: 95-33D1

Date : July 21, 1999

Assistant Commissioner for Patents

Washington, D.C. 20231

Declaration Under 37 C.F.R. § 1.131

Sir:

We, James W. Baumgartner, Theresa M. Farrah, Donald C. Foster, Frank J. Grant, and Patrick J. O'Hara, do hereby declare as follows:

1. We are the inventors of the above-identified patent application.

2. All of the work described herein was performed in the United States of America by us or under our direction.

3. We have reviewed laboratory notes and other records, including the exhibits submitted herewith, and have determined that the invention recited in claims 1-32 of the above-identified patent application was reduced to practice before March 1, 1996 or was conceived before March 1, 1996 and was subsequently constructively reduced to practice with the filing of the patent application on March 13, 1996.

4. Attached hereto as Exhibit 1 is a copy of a computer printout of the DNA and deduced amino acid sequence of a clone designated "zcytor2." This printout is dated

prior to March 1, 1996. The sequences shown in Exhibit 1 correspond to those disclosed in the patent application in SEQ ID NO:1 and SEQ ID NO:2.

5. Attached hereto as Exhibit 2 is a copy of a portion of a memo written by one of us (Frank J. Grant) before March 1, 1996, which describes particular goals for the WSXWS receptor project, which project included the zcytor2 receptor. As stated in the memo, these goals included preparation of soluble forms (i.e., extracellular ligand-binding domains) of receptors. The memo also describes our intent to clone and express full-length, receptor-encoding cDNAs.

6. Attached hereto as Exhibit 3 is a copy of a page from the notebook of Cameron Brandt, a research associate working under our direction. This page, written before March 1, 1996, describes a plan to prepare polypeptide fusions comprising a soluble receptor and an immunoglobulin Fc polypeptide.

7. Attached hereto as Exhibit 4 is a copy of a slide prepared by one of us (Donald C. Foster) for an in-house seminar on the WSXWS receptor project. This slide was prepared before March 1, 1996. This slide illustrates a plan to express new receptor-encoding DNAs in cultured cells, whereby the cells would produce the encoded receptor.

8. On the basis of these Exhibits we conclude that the invention recited in claims 1-32 of the patent application was reduced to practice before March 1, 1996 or was conceived before March 1, 1996 and was subsequently constructively reduced to practice with the filing of the patent application on March 13, 1996.

We further declare that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further, that these statements were made with the knowledge that the making of willfully false statements and the like is punishable by fine or imprisonment, or both, under

Section 1001 of Title 18 of the United States Code, and may jeopardize the validity of any patent issuing from this patent application.

DRAFT

HEALTH DEPT.

Outline of things to consider for patent application of novel type I cytokine receptors

We have identified partial cDNA sequences for three new members of the type I cytokine receptor family. These receptors are characterized by a conserved cysteine pattern and an amino acid motif containing WSXWS. Members of this family include the receptors for TPO, EPO, Growth Hormone, Prolactin, IL-4, IL-7, IL-9, IL-2, IL-5, IL-3, GM-CSF, IL-6, CNTF, G-CSF and Leukemia inhibitory factor.

The main utility for these sequences would be to facilitate the cloning of the unknown ligands for the receptors. The receptors themselves (ie. soluble forms) might be potential therapeutics as well.

There are at least three ways the receptor sequence can be utilized to clone the ligands:

- a). Make receptor dependent cell lines (as was done in the [REDACTED] project) for use in an expression cloning project.
- b). Soluble forms of the receptor can be labeled and used as probes in an expression cloning system.
- c). The receptor could be attached to various columns or other supports and used to purify the ligand.

Patentable entities: (???????)

- a). The EST (expressed sequence tag) that allowed us to identify the partial sequence as novel member of the family. — *came from [REDACTED]*
- i). Allows us to clone the full length cDNA.
- b). The full length receptor encoding cDNA.
- c). Homologues of the cDNAs. It may be that murine versions of these receptors are necessary for ligand dependent cell line cloning.
- d). The ligands for the receptors.
- e). AIDS therapies. — *Discuss w/ Frank*

WHAT WE GOT:

- a). [REDACTED]
- b). [REDACTED]
- i). [REDACTED]
- ii). [REDACTED]
- c). [REDACTED]

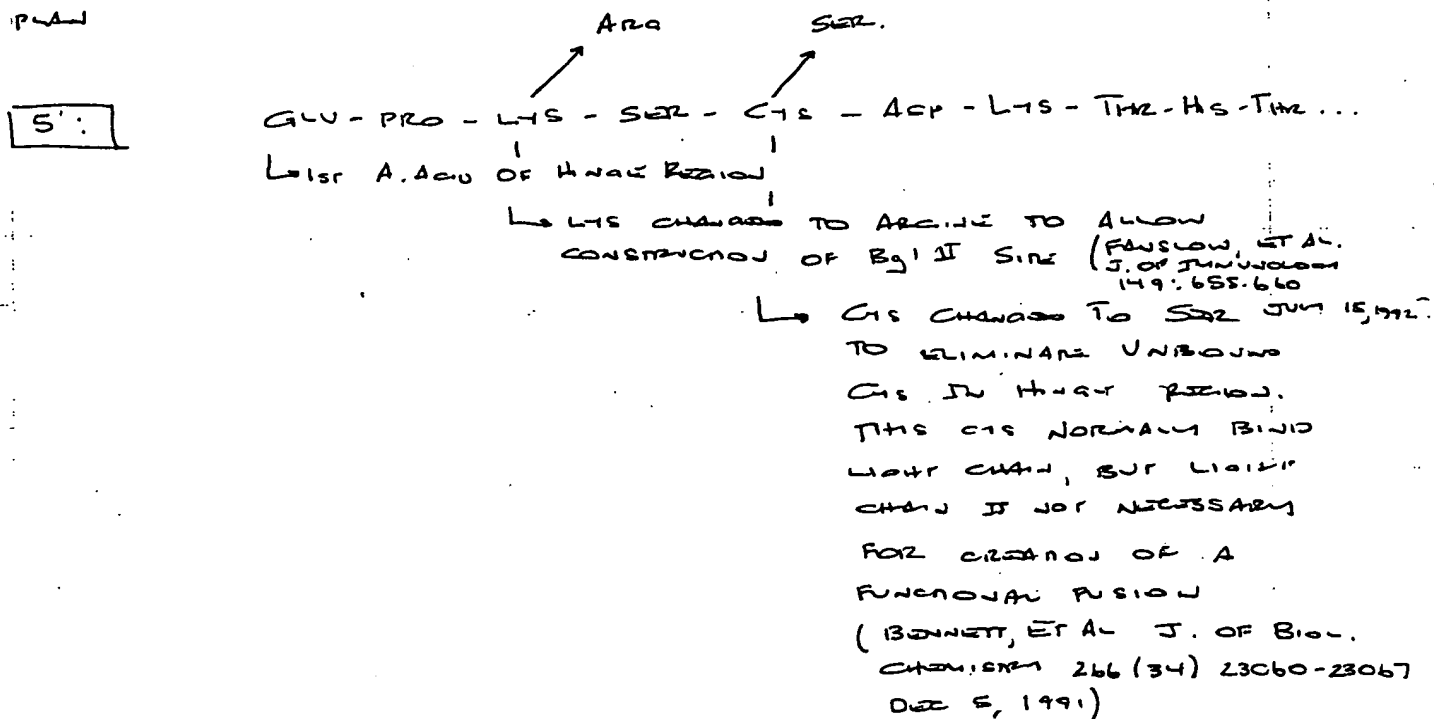

[REDACTED]

PURPOSE: WILL BUILD A VECTOR FOR EXPRESSION OF SOLUBLE RECEPTORS FUSED TO IgG J, HEAVY CHAIN. THIS EXPRESSION SYSTEM ALLOWS AN EASY WAY TO PURIFY SOLUBLE RECEPTOR OVER A PROTEIN A COLUMN. IT THEN PROVIDES A HANDLE FOR USING IN SOLING AFTER LIGAND.

- Iga portion of fusion includes H₁A regions CH₂, CH₃
- Fusion is considered as a monomer but dimerizes via it's two Cysteine's in the H₁A region
